

# WexMaster Polygon

Smart Contract Audit Report

Prepared for Wault Finance

---

**Date Issued:** Jun 13, 2021

**Project ID:** AUDIT2021004

**Version:** v1.0

**Confidentiality Level:** Public

## Report Information

## 1. Executive Summary

As requested by Wault Finance, Inspex team conducted an audit to verify the security posture of the WexMaster Polygon smart contracts on Jun 12, 2021. During the audit, Inspex team examined all smart contracts and the overall operation within the scope to understand the overview of WexMaster Polygon smart contracts. Static code analysis, dynamic analysis, and manual review were done in conjunction to identify smart contract vulnerabilities together with technical & business logic flaws that may be exposed to the potential risk of the platform and the ecosystem. Practical recommendations are provided according to each vulnerability found, and should be followed to remediate the issue.

### 1.1. Audit Result

In the initial audit, Inspex found only 1 low-severity issue, and the issue was acknowledged by the Wault Finance team. Therefore, Inspex trusts that the WexMaster Polygon smart contract has sufficient protections to be safe for public use. However, in the long run, Inspex suggests resolving all issues found in this report.

### 1.2. Disclaimer

This security audit is not produced to supplant any other type of assessment and does not guarantee the discovery of all security vulnerabilities within the scope of the assessment. However, we warrant that this audit is conducted with goodwill, professional approach, and competence. Since an assessment from one single party cannot be confirmed to cover all possible issues within the smart contract(s), Inspex suggests conducting multiple independent assessments to minimize the risks. Lastly, nothing contained in this audit report should be considered as investment advice.

## 2. Project Overview

### 2.1. Project Introduction

WexMaster is a smart contract made to distribute Wault Finance platform's governance token. The users can stake predefined tokens into the pools to gain the governance token as a reward. The past version of this smart contract has been deployed on the Binance Smart Chain, and Wault Finance has resolved the issues found from the previous version in preparation for the deployment on Polygon.

#### Scope Information:

|                      |   |
|----------------------|---|
| Project Name         | WexMaster Polygon   |
| Website              | <a href="https://wault.finance/">https://wault.finance/</a> |
| Smart Contract Type  | Ethereum Smart Contract                                     |
| Programming Language | Solidity  |

#### Audit Information:

|              |              |
|--------------|--------------|
| Audit Method | Whitebox     |
| Audit Date   | Jun 12, 2021 |

### 2.2. Scope

The following smart contracts were audited and reassessed by Inspex in detail:

#### Initial Audit:

| Name          | Location (URL)  |
|---------------|---|
| WexMaster.sol | <a href="https://github.com/WaultFinance/WAULT/blob/b995392a67c7ffb5bcd36297a11f9ac7c98ed41/contracts/WexMaster.sol">https://github.com/WaultFinance/WAULT/blob/b995392a67c7ffb5bcd36297a11f9ac7c98ed41/contracts/WexMaster.sol</a> |

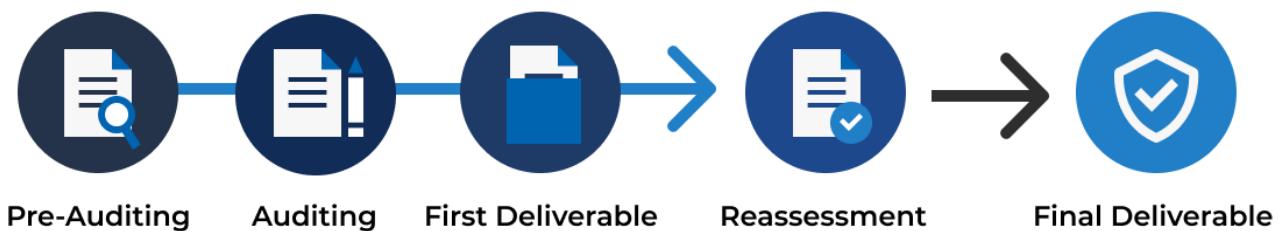

#### Reassessment:

There is no issue that needed the reassessment activity.

### 3. Methodology

Inspex conducts the following procedure to enhance the security level of our clients' smart contracts:

1. **Pre-Auditing:** Getting to understand the overall operations of the related smart contracts, checking for readiness, and preparing for the auditing
2. **Auditing:** Inspecting the smart contracts using automated analysis tools and manual analysis by a team of professionals
3. **First Deliverable and Consulting:** Delivering a preliminary report on the findings with suggestions on how to remediate those issues and providing consultation
4. **Reassessment:** Verifying the status of the issues and whether there are any other complications in the fixes applied
5. **Final Deliverable:** Providing a full report with the detailed status of each issue

#### 3.1. Test Categories

Inspex smart contract auditing methodology consists of both automated testing with scanning tools and manual testing by experienced testers. We have categorized the tests into 3 categories as follows:

1. **General Smart Contract Vulnerability (General)** - Smart contracts are analyzed automatically using static code analysis tools for general smart contract coding bugs, which are then verified manually to remove all false positives generated.
2. **Advanced Smart Contract Vulnerability (Advanced)** - The workflow, logic, and the actual behavior of the smart contracts are manually analyzed in-depth to determine any flaws that can cause technical or business damage to the smart contracts or the users of the smart contracts.
3. **Smart Contract Best Practice (Best Practice)** - The code of smart contracts is then analyzed from the development perspective, providing suggestions to improve the overall code quality using standardized best practices.

### 3.2. Audit Items

The following audit items were checked during the auditing activity.

| General                                     |
|---|
| Reentrancy Attack                           |
| Integer Overflows and Underflows            |
| Unchecked Return Values for Low-Level Calls |
| Bad Randomness                              |
| Transaction Ordering Dependence             |
| Time Manipulation                           |
| Short Address Attack                        |
| Outdated Compiler Version                   |
| Use of Known Vulnerable Component           |
| Deprecated Solidity Features                |
| Use of Deprecated Component                 |
| Loop with High Gas Consumption              |
| Unauthorized Self-destruct                  |
| Redundant Fallback Function                 |
| Advanced                                    |
| Business Logic Flaw                         |
| Ownership Takeover                          |
| Broken Access Control                       |
| Broken Authentication                       |
| Upgradable Without Timelock                 |
| Improper Kill-Switch Mechanism              |
| Improper Front-end Integration              |
| Insecure Smart Contract Initiation          |

| Best Practice                      |
|------------------------------------|
| Denial of Service                  |
| Improper Oracle Usage              |
| Memory Corruption                  |
| Use of Variadic Byte Array         |
| Implicit Compiler Version          |
| Implicit Visibility Level          |
| Implicit Type Inference            |
| Function Declaration Inconsistency |
| Token API Violation                |
| Best Practices Violation           |

### 3.3. Risk Rating

OWASP Risk Rating Methodology[1] is used to determine the severity of each issue with the following criteria:

- **Likelihood**: a measure of how likely this vulnerability is to be uncovered and exploited by an attacker.
- **Impact**: a measure of the damage caused by a successful attack

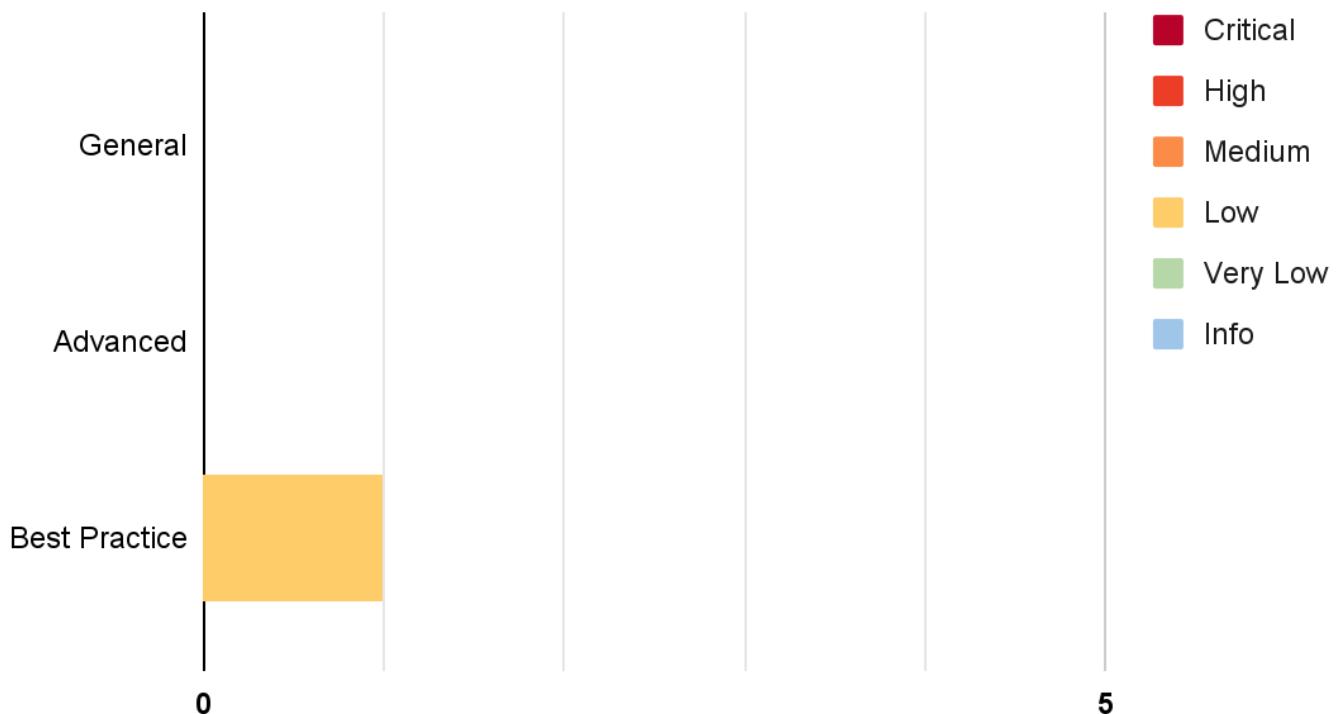

Both likelihood and impact can be categorized into three levels: **Low**, **Medium**, and **High**.

**Severity** is the overall risk of the issue. It can be categorized into five levels: **Very Low**, **Low**, **Medium**, **High**, and **Critical**. It is calculated from the combination of likelihood and impact factors using the matrix below. The severity of findings with no likelihood or impact would be categorized as **Info**.

| Likelihood<br>Impact | Low      | Medium | High     |
|----------------------|----------|--------|----------|
| Low                  | Very Low | Low    | Medium   |
| Medium               | Low      | Medium | High     |
| High                 | Medium   | High   | Critical |

## 4. Summary of Findings

From the assessments, Inspex has found 1 issue in three categories. The following chart shows the number of the issues categorized into three categories: **General**, **Advanced**, and **Best Practice**.

The statuses of the issues are defined as follows:

| Status             | Description   |
|--------------------|---|
| Resolved           | The issue has been resolved and has no further complication.  |
| Resolved *         | The issue has been resolved with mitigations and clarifications. For the clarification or mitigation detail, please refer to Chapter 5. |
| Acknowledged       | The issue's risk has been acknowledged and accepted.  |
| No Security Impact | The best practice recommendation has been acknowledged.   |

The information and status of each issue can be found in the following table:

| ID      | Title                             | Category | Severity | Status       |
|---------|-----------------------------------|----------|----------|--------------|
| IDX-001 | Improper Update of State Variable | General  | Low      | Acknowledged |

## 5. Detailed Findings Information

### 5.1. Potential Centralized Control of State Variable

|          |   |
|----------|---|
| ID       | IDX-001   |
| Target   | WexMaster.sol   |
| Category | Smart Contract Best Practice  |
| CWE      | CWE-710: Improper Adherence to Coding Standards   |
| Risk     | <p><b>Severity:</b> <span style="color: yellow;">Low</span></p> <p><b>Impact:</b> <span style="color: orange;">Medium</span><br/>The controlling authorities can change the critical state variables to gain additional profit. Thus, it is unfair to the other users.</p> <p><b>Likelihood:</b> <span style="color: yellow;">Low</span><br/>There is nothing to restrict the changes from being done; however, the changes are limited by fixed values in the smart contracts.</p> |
| Status   | <p><b>Acknowledged</b></p> <p>The issue's risk has been acknowledged and accepted.</p>  |

#### 5.1.1. Description

Critical state variables can be updated any time by the controlling authorities. Changes in these variables can cause impacts to the users, so the users should accept or be notified before these changes are effective.

However, there is currently no constraint to prevent the authorities from modifying these variables without notifying the users.

The controllable privileged state update functions are as follows:

| Targets                | Function         | Modifier  |
|------------------------|------------------|-----------|
| WexMaster.sol (L:1297) | add()            | onlyOwner |
| WexMaster.sol (L:1318) | remove()         | onlyOwner |
| WexMaster.sol (L:1328) | set()            | onlyOwner |
| WexMaster.sol (L:1481) | setWexPerBlock() | onlyOwner |

### 5.1.2. Recommendation

In the ideal case, the critical state variables should not be modifiable to keep the integrity of the smart contract. However, if modifications are needed, Inspect suggests limiting the use of these functions via the following options:

- Implementing a community-run governance to control the use of these functions
- Using a Timelock contract to delay the changes for a reasonable amount of time

## 6. Appendix

### 6.1. About Inspex

## CYBERSECURITY PROFESSIONAL SERVICE

Inspex is formed by a team of cybersecurity experts highly experienced in various fields of cybersecurity. We provide blockchain and smart contract professional services at the highest quality to enhance the security of our clients and the overall blockchain ecosystem.
